Ether-Influx Gravity

Abstract

Gravity^[1] is a kinetic interaction between our Earth and the high-energy Ether of the Universe. Nothing else is required. You may replace Earth with any Planet, Sun, Star or Black Hole. Creating gravity is a simple kinetic process for every one of them.

The Universe is a giant self-contained ball of Ether of high energy Gravitons. Inside Moons, Planets, Suns, Stars, and Black Holes, a simple kinetic process of collisions reduces the average kinetic energy density by about ~12%, causing a global ether flow from the Universe into Earth and the other masses, proportional to the size of the mass. The incoming Ether flow is Gravity.

There are side effects. The ether flow gains velocity, momentum, and kinetic energy. Once inside Earth, that energy is converted into photons of wide variety and expelled. The process is identical for Moons, Planets, Stars, and Black Holes and we can observe it as the Luminosity of our Sun.

Notes.

Over 300 years ago Newton has reverse engineered his famous equation of *Universal Attraction of Masses*^[4] from data collected by his fellow astronomers and scientists. With the experimental determination of the fudge factor G, this equation served humanity ever since, though nobody understood the actual mechanical action of attraction. There were attempts to solve the mystery without success as Gravitational Fields and Space-bending Geodesics and lately as *Quantum Gravity* but were not any better to explain the Kinetic Nature of Gravity.

Let me assure you that Gravity^[1] is caused by a kinetic process, collision of masses, that also explains the Pioneer Anomaly^[7], solves the Sun's Coronal heating mystery and the superluminal ejection of matter from Black Holes.

The Michelson, Morley, Lorentz fiasco.

From the Greek Masters we inherited the concept of Ether without any details. *God used Ether to delineate the Universe.* Ether is a ~1/12 size version of Hydrogen gas distinguishing *our Universe* from the infinite Void surrounding it. Ether is the infrastructure of our Universe. At the time of Plato, Earth was deemed Flat, and everything was *falling down*. Two-thousand years later Earth was reclassified a planet and according to Fatio, LeSage and others, tiny corpuscles of Ether bombarded Earth and other Planets, causing gravity. Gravity pointed to the center of Earth.

According to Wikipedia, Fresnel, Maxwell, Fizeau and other scientists were proposing that a Luminiferous Ether, dragged by Earth propagates Light and Electromagnetic Waves. At the time nobody was talking about Zero-point energy, the high pressure of ether, the Strong Force.

Others were bent on proving that ether did not exist. The first M&M experiment^[6] was conducted in 1881 and repeated in 1887 by Michelson and Morley. Albert Einstein was born in 1879 and at the time of the second M&M experiment in 1887 he was only 8 years old, not ready for scientific investigations.

Lorentz and a long list of scientific collaborators were busy explaining the null results of the useless M&M experiments. These incompetent experts were looking for ether moving parallel to Earth's surface in the horizontal direction. Fatio and Le Sage clearly pointed out that ether gravity moves in the vertical

direction. Michelson and Morley kept repeating the same experiment with more precision, for many more years. Lorentz proved that with equations he can create anything.

Nineteen years later in 1906 Mr. Einstein, a young upcoming scientist, decided to include this new *no-ether science* in his book. Jumping on the bandwagon was an easy decision. Lorentz justified with his transform equations that ether was not needed for the propagation of light, or anything else and Einstein fell for the convincing equations. Gravity was ignored, though they were standing on it.

A few years later, Einstein stated^[3] that his General Relativity needs an ether. But the damage was done. Thousands of students and the general public were already indoctrinated with the *no-ether dogma crediting* Einstein's Book for it. The students became the new leaders, and the scientific world was led into a 120-year-long dark age of misinformation, still going on today. To hide their mistake, the *scientists* are now promoting dark-matter and dark-energy to replace ether, but those things are not cooperating by hiding.

If you check with the Physics Department of Universities, you will find that they are still confused and paralyzed with this *no-ether religion*, as nobody wants to jeopardize their precious faculty jobs. The experts are leading each other in circles because they do not want to admit that ether is the main component of the Universe. Gravity can't be created by fake fields or bent space-time in an ether-less empty space.

We use the name Graviton for the individual particles of ether. The name is very fitting, as Gravitons are the particles creating Gravity with their momentum.

Ether has no written history because of denial and neglect. We have not found any information about ether's pressure, the famous zero-point energy. There is no description of Gravitons, their size and their many functions. Our Universe was created with ether by adding large amounts of energy. Ether's internal pressure drives the expansion of the Universe. Ether's pressure holds together atoms, molecules and other structures made from Nucleons serving as the strong force. Ether also propagates light in the form of photons. Without ether there is no Universe.

This paper is about Ether-Influx Gravity in a Kinetic Universe. You will not find in here any hubris about fields and other imaginary action-at-a-distance events. Newton's Equation of Universal Attraction gives correct numerical

results for a static system, but it is a fake field equation. Mr. Newton was a great scientist, mathematical genius developing calculus, and a close friend of Fatio.

Introduction of the Ether-Influx Gravity.

This Universe is filled with Ether, a high-energy mono-gas of Gravitons. About 12% of the Sun's volume is occupied by Nucleons, reducing the energy density, the average pressure within the Sun by about 12%. An influx of ether from the Universe moves into the Sun to correct the situation. The kinetic energy of this global ether-influx provides the energy for the Sun's Luminosity of 3.838×10^{26} Watt, making any Fusion process unnecessary. Per our calculations, the global ether-influx speed is 10,800 m/s at the Sun's surface; it is reduced to 0.165 m/s at the distance of one light-year, and it is 3.8×10^{-11} m/s at ten light-year distance. The velocity follows the $1/R^2$ rule for a sphere.

It is like a global shrinkage, compensated by the expansion of the Universe.

The ether-influx for every Sun, Planet, Moon, and Black Hole in the Milky Way is combined for the total ether loss. For reference, the Milky Way's diameter is ~80 thousand light-years, and it is 5 to 10 thousand light-year thick. Still the expansion of the Universe is winning the race.

Ether-influx velocity at the surface of Earth is 387 m/s, creating Gravity of 9.81 m/s^2 .

So-called free-falling objects are not free falling. They are carried by the ether influx and could never achieve a higher speed than the flow of ether.

At this point we are ready to present the details of Kinetic Gravity.

Empty Space. Empty Space is outside of our Universe. Its existence is unconditional. It stretches forever in all directions, but has no energy of any kind. It contains at least one Universe, ours, maybe more, we will never know. Empty space is the perfect insulator. Nothing exists in empty space, except very basic building blocks: Ether, electrons, and nucleons, but to become functional, they need large amounts of kinetic energy.

Our Universe is a giant self-contained ball of energetic Ether of Gravitons. The energy density of Ether was much higher in earlier times but the expansion of the Universe into empty space reduced its density, energy density and pressure.

Ether^[2] is a monatomic gas of Gravitons, of considerable energy density of **10 Terapascal**. The proposed size and mass of an individual Graviton is listed

in Table 1 along with Electron and Nucleon listed for comparison. For lack of published physical data, we decided on a geometric regression. Please, list your preferred numbers. Gravitons' average random thermal velocity is about ~1.5 times c . Think of Gravitons bombarding molecules, atoms, electrons and each other from every directions at 1.5 times the speed of light to maintain the quoted pressure and to provide the energy to carry photons.

	Graviton	Electron	Nucleon	Units
Diameter	7.437E-14	9.11E-13	1.116E-11	m
Diameter Ratio	1	12.25	150	Graviton
Diameter Ratio		1	12.25	Electron
Mass	4.956E-34	9.109E-31	1.674E-27	kg
Mass Ratio	1	1838	3.378E+06	Graviton
Mass Ratio		1	1838	Electron

Table 1, Basic Particles

Ether's pressure is the **Strong Force**, holding together nucleons into atoms, molecules and larger structures, resulting in materials' tensile strength. I want to call your attention to the giant animals and giant trees of 100 million years ago, when ether pressure was considerably higher than today.

Electrons and Nucleons have diameters 12.25 and 150 times larger than Gravitons, and their mass are also listed in Table 1. None of these particles have **electric charge**. An electric charge would need an electric field, and we know there are no fields of any kind. The electric charge is a manifestation of the temporarily elevated pressure of the local ether around electrons, and a reduced pressure around protons. The result of these collisions are that Electrons want to disperse, and Nucleons and other large masses want to congregate.

Gravity Flux. The concept of gravity flux helped me to understand that the M&M experiment was designed to fail. Ether is moving toward the center of the Sun and toward the center of any mass. Gravity flux also helped to understand that there is nothing special about the Sun other than it has the mass of 1047 Jupiters.

Table 2. Gravity Flux Meaningless Numbers.

On a day some time ago I was moving numbers around to make sense of them. The Sun and every planet has a surface and a gravity at that surface. Our Earth has a surface of 5.101E+14 m², and the gravity is 9.81 m/s². Multiply gravity with surface we get Gravity Flux. Dividing Gravity Flux of Earth by the mass of Earth results in 8.376E-10, a meaningless number, but Column G of Table 2 shows that this number is very similar to the numbers for the Moon, for all planets and for our Sun. Column G of Table 2 shows that the Sun is just another planet, a king-size Planet. The cause of deviation for Saturn's and Jupiter's reduced numbers is unknown. It could be caused by density differentials or incorrect data.

It became clear that an ether-influx of Gravitons is moving toward the center of the Sun or the particular planet. The speed of the ether influx depends on the mass of planet or the Sun. The ether influx is driven by the energy density differential of ether between the inside and outside of the Sun or planets.

If a non-orbiting mass is caught in this ether-influx, it is carried toward the mass that created the ether-influx. There is no gravity, no gravitational field between masses. In fact an ether-influx is established by each and every mass in the ether filled Universe.

Creating the energy density differential is a simple kinetic process. Think of matter as only ~12% nucleons, atoms, molecules and 88% ether. Nucleons, atoms, molecules pass on their acquired energy in the form of photons. This is a simple kinetic action, collision of particles having masses. No need for quantum mechanics, whatever that is or other curiosities of deep minds.

Kinetic Theory of Gas Pressure^[9]. The energy density of gas is

$$E = m \times v^2 / 2 \quad \text{joule/m}^3$$

where v is the average velocity of gas molecules and m is the density of gas, or mass of one m^3 of gas. Half of this E value is the measurable pressure

$$p = m \times v^2 / 4 \quad \text{pascal/m}^2$$

The calculated molecular velocity of air is $v = 580 \text{ m/s}$. The measured speed of sound in air is 340 m/s . The ratio is ~1.7. For Neon gas this ratio is 1.5. Our next step is to scale this information to the world of Ether^[2].

The speed of light photons^[8] in ether is $300,000 \text{ km/s}$, a very impressive speed. The velocity of individual Gravitons is ~1.5 c . From the tensile strength of metals and carbon fiber we estimate ether's energy density at 10 Terapascal. These numbers will yield an Ether density of 100 mg/m^3 . The mass of an individual Graviton of ether is estimated to be $1/1838$ of the mass of an electron (see Table 1 on page 3).

Let me ask the reader to imagine that the Universe is a **giant ball of Ether**, that was much smaller billions of years ago, as it is expanding because it has no container. Disregard the idle talk about dark matter and dark energy, we have high pressure ether. Atoms and molecules are floating in this Ether pool without weight, as **there is No Gravity**. Let me repeat: **There is No Gravity**.

Ether Inflow's Kinetic Energy at the surface of the Sun

Energy output of the Sun is its Luminosity. The energy input is the kinetic energy of the ether-influx velocity that is crossing the Sun's surface every second.

$$\text{Energy} \quad E = mass \times \frac{v^2}{2} \quad (\text{equ.1})$$

$$\text{Substituting} \quad mass = A \times v \times D$$

$$E = A \times v \times D \times \frac{v^2}{2} = A \times D \times \frac{v^3}{2}$$

$$\text{Resolve for velocity} \quad v = \sqrt[3]{\frac{2 \times E}{A \times D}}$$

E = luminosity of Sun	3.838E+26	Watt
A = surface of Sun.	6.090E+18	m ²
D = density of Ether = 100 mg/m ³ .	1.000E-04	kg/m ³
m = mass of Ether-influx per second		kg
v = velocity of Ether-influx at Sun's surface	1.080E+04	m/s

Energy Influx, Energy outflow

According to Wikipedia, the Sun's luminosity is 3.838x10²⁶ Watt. This energy is created from the kinetic energy of the Ether-influx of **10.8 km/s**, measured at the Sun's surface, causing a solar gravity of 274 m/s². The drag ratio is 1/39.42.

Fusion Power in the Sun does not exist and is not required.

For this paper we shall ignore other energy outflows like the Coronal Mass Ejections and Solar River^[10]. We suppose that those outflows would be covered by the floating debris brought in with the ether-influx. The 10.8 km/s is also the terminal velocity of free-floating objects before crashing into the Sun.

For now, we are blaming this energy of the Ether inflow for the very high coronal temperature. The Corona is the first layer of the Sun buffeted by the Ether-influx with its 10.8 km/s velocity. Energy losses for cooling the inner layers of the Sun are mostly photons, but also some solar mass ejections.

With a simplified procedure we calculate the Ether flow velocity for each planet in the Solar system as they relate to the Sun's Ether flow velocity with Ether density of 100 mg/m³.

Incoming Power for Planets

Table 3 also shows that the Sun is just an overgrown planet that pulls in one thousand times the Ether mass pulled in by Jupiter and can't get rid of this kinetic energy ($m \cdot v^2/2$) in the form of photons fast enough, so it overheats, and glows brightly to increase the photon output.

The Sun's density is almost equal to Jupiter's density. We believe that the Sun gets all its energy from the Ether-influx and there is **No Fusion process** within the Sun, or anywhere in the Universe. The Fusion Process of the early Universe stored energy in Atoms. I defer explanations and precise calculations to the experts. We are looking for the truth. And we need help.

The prediction of the Sun's death due to running out of fuel is presumptuous. The Sun does not use internal fuel. The Sun uses the Ether influx's kinetic energy for fuel. The Sun will either grow into a Black Hole by capturing matter, or slowly diminish with the expansion of the Universe as the energy density of Ether diminishes.

			Ether	Calculated
Planet	Gravity	Multiplier	Influx	Ether Influx
			Speed	Energy
	m/s ²	**	m/s	Watts *
Moon	1.62	39.42	64	9.967E+14
Mercury	3.70	39.42	146	2.329E+16
Venus	8.87	39.42	350	1.973E+18
Earth	9.81	39.42	387	2.966E+18
Mars	3.72	39.42	147	4.593E+16
Jupiter	24.79	39.42	977	5.743E+21
Saturn	10.44	39.42	412	2.976E+20
Uranus	8.69	39.42	343	3.263E+19
Neptune	11.15	39.42	440	6.702E+19
Sun	274.00	39.42	10801	3.828E+26

Table 3. Ether-influx Power Input

* Using equation (1) on page 5

**Ether-influx Velocity to Gravity ratio is $\sim 1/39.42$

The surface temperature on Venus is around 1500° C mainly due to its heavy cloud layer that retains most of the incoming Ether flow energy.

The Pioneer program noted very high infrared radiation from the outer giants Jupiter, Saturn, Neptune and Uranus^[11]. Uranus has the smallest mass of the four, collecting the least amount of ether energy.

The Ether-influx gravity model creates interesting side effects, like the Pioneer Anomaly^[7]. Here a ballistic satellite moving away from the Sun is buffeted by the Sun-bound Ether flow, causing additional loss of momentum / speed. Would Mr. Newton be surprised?

Brown Dwarfs, Suns, Black Holes, Super Massive Black Holes are able to exist because their masses create their own Ether-influx gravity. Any mass, or planet caught in the Ether-influx flow will be carried inside and never to be seen again until the next Universal Mass Recycling Event.

As the mass of these objects increases, so does their Ether-influx and their gravity. But there is a point where the pressure differential can't grow further. The object's mass may grow, but the Ether-influx's size increase flattens out.

There is an uncharted territory here and I hope the scientific community will be interested to find answers. It is possible that one or a few supermassive black holes will gobble up all the masses in the Universe, but in the end the reduced ether pressure will not be able to hold them together and they will fall apart.

Gravitational Lensing^[12] is a simple physical event. Light Photons are traveling in ether at the speed of light at 300,000 km/s in a straight line close to the surface of the Sun. At the Sun's surface the Ether-influx is moving into the Sun at the estimated speed of 10.8 km/s, a measly 0.0036 % of c, always perpendicular to the surface of the Sun. Photons traveling close to the Sun are pushed toward the Sun by the Ether-influx in an arc segment around the Sun. This is similar to pushing a planet to circle around the Sun or forcing the Moon to circle around Earth in an orbit.

Black Holes The pictures used in publications to depict Black Holes are **fabrications** to help perpetuate a hoax by people who have no idea what a black hole is. **Black Holes** are giant Suns, but the speed of ether-influx into these giant Suns is high enough to overcome the speed of photons trying to escape, so we can't see their glow. There is no pressure or energy density anywhere in the Universe larger than the pressure of intergalactic Ether. Inside any mass the ether pressure is reduced to keep the Ether-influx flowing into the mass to keep *creating gravity*. In "Black Holes" the accumulating ether mass is ejected at super-luminal speeds.

Energy Sources of the Solar System

We already decided that the Sun receives all its energy from the Universe in the form of kinetic energy of the Ether-influx. The planets also receive Ether flow energy but in addition are the beneficiaries of radiated energy of the Sun, carried by photons, that was part of the incoming Ether energy into the Sun.

In Table 4, we include our Moon to show that it is like a planet. The Sun is also a giant Planet without Fusion process.

From Wikipedia, the Sun's Luminosity is $3.828E+26$ Watts.

	A	B	C = A + B	D = A / B	E = B / C	F = A / C	G = 100xF
	Sun Heat Received Watts	Ether River E Watts	Incoming Total E Watts	Solar E / Ether E Ratio	Ether E /Total E % %	Solar E /Total E %	Solar E /Total E %

Table 4. Energy Sources of Planets

Column A = Radiated (photon) Heat received from the Sun.

Column B = Kinetic Energy received from the Universe as Ether Flow.

Column C = Total Energy received. Column A and B combined.

Column D = Column A divided by Column B.

Column E = Ether energy inflow as % of the total.

Column F = Solar energy as % of the total.

Column G = Column F in percentages. Pity the outer 4 Giants.

Fusion Energy^[13]

The famous century old equation $E = m \cdot c^2$ is based on the idea of mass-energy equivalence and on the idea that an accelerated mass increases its mass. The dimensions of this equation are correct, but the idea of converting mass into energy is based on wishful thinking and hallucinations. This equation has convinced nations to spend enormous amounts of wealth and effort on the development of fusion energy and to create hydrogen bombs. Lucky for us **this equation does not work**. Hydrogen bombs do not exist; they are supped up fission bombs. The lies of competitive physicists of the nuclear age.

Sustained Fusion to create energy is a dream of the new alchemists that cannot be achieved in today's Universe. Fusion worked for the first billion years into the life of this Universe, when ether pressure was ten- or hundred-times today's value and fusion served as energy storage process by assembling Nucleons into larger Atoms. Fusion does not create energy. Mass is not converted into energy. Accelerating a mass does not make it more massive.

Unlimited cheap fusion energy would accelerate the climate warming of our Earth. Runaway fusion could make this Universe into a giant heap of foam.

The idea of fusion follows the dream of the alchemist: convert Lead into Gold. Supposedly Newton was an alchemist along with his friend Fatio. I wonder if the alchemists really believed that they could convert Lead into Gold by cooking it, or if they were just looting the King's treasures? Today, massive amounts of Treasury Money is supporting a lame Fusion Industry. The money-peoples' goal is creating cheap energy, not building more powerful lasers. Fission Power is also bad for the environment. Fission releases the fusion energy locked up in Atoms billions of years ago at Fusion time. Fission also contributes to climate warming.

Green Energy

Green energy is energy received unconditionally, whether we want it or not, from the Sun in the form of Sunlight, and from the Universe as Ether-influx energy. They are part of the overall thermal equation that will determine our future, and we can't do anything about them

Timeline of Gravity Ideas

Plato and the Greek masters called it Ether

Fatio called it the tiny corpuscles of the Universe

Newton called it Gravity = $G \times m_1 \times m_2 / r^2$

Others called it Gravitational Field

Einstein called it Mass Geodesics

We name it Ether-Influx, that also makes the Sun glow

The idea of Push-Gravity has been around for many years. The missing item was the source and the agent of the push. In the Kinetic Universe force is mitigated with collisions of masses. Fields, curved geodesics, quantum ideas will not be sufficient. We count on you to develop that Unified Physical World.

Unresolved Issues

Cooling of the center of the Sun below the temperature of the Corona.

We must mention that as the ether flow into the Sun keeps the planets in orbit, every planet has its own ether gravity to pull on the Sun and every other planets. In Newton's equation the G constant took care of the mutual gravity between two planets or the Sun and a planet. In our ether-flux gravity, we could add up the vectors of the ether flows at any particular point and with the drag conversion number calculate the resulting force.

As gravity is established between the Sun and the ether of the Universe, it is ready for Earth at any point in its orbit when gets there. The orbit stability is still a problem as the Moon's orbit is getting measurably bigger, but it is a smaller problem.

Another problem to investigate is ether's drag on planets and moons.

Most planets rotate and circulate in the same direction, dictated by dragged ether. This must be the reason for the flat shape of the Solar System and the Milky Way Galaxy.

List of Particulars

The Milky Way Galaxy is big. Its **diameter is about 90-thousand light years**, and it is **5 to 10-thousand light years thick**. Our Solar System is located 27-thousand light years from the center of rotation of the galaxy.

Our Sun is a gas-giant. Its equatorial Radius is 695,700 km.

If Earth was at the center of the Sun, the Moon's orbit would be also inside the Sun at 405,400 km. radius.

Telescopes do not look back in time. Telescopes see photons arriving at their mirror now, after traveling billions of years.

Information received is not time-stamped, it could be Billions of years old.

For distance differentiation, stereo vision is required.

For now Astronomers are using Parallax and other triangulation techniques.

Photons from the Big-Bang zoomed by us long time ago. Needs review.

Photons are energy pockets carried by ether at the speed of light.

The diameter of a photon is half wavelength.

Speed of light is relative to the local Ether.

Electrons and Protons are not limited to any speed.

Electrons do not orbit Nucleons. The Bohr Atom doesn't exist.

Protons and Neutrons are identical; their matter density is $2.2 \times 10^6 \text{ kg/m}^3$.^[5]

Protons are on the outside of atoms, exposed to ether.

Neutrons are internal to the atom. There are no free Neutrons.

Black Holes are overgrown Suns.

Ether's energy is the source of all energies.

Individual Graviton's velocity is $\sim 1.5c$.

Gravitons are too small; they can't create photons.

Photons created by Nucleons and electrons are carried by ether at speed of c .

Ether's density is 100 mg/m^3 . Ether's energy density is 10 Terapascal.

The Process of Gravity:

In the Sun, $\sim 12\%$ of volume is occupied by nucleons and electrons.

Ether's local energy density in the Sun is reduced by $\sim 12\%$.

The reduced energy density creates a global influx of ether into the Sun.

Global influx of ether acquires speed – kinetic energy.

Ether-influx's velocity and momentum is the cause of gravity.

Velocity to Gravity drag conversion factor is $1/39.42$ at the surface of the Sun

For our Sun, 10.8 km/s ether-influx speed results in a gravity of 274 m/s^2 .

Global ether-influx transfers its kinetic energy to the Sun's Corona and beyond.

This energy causes the Corona's high temperature and the Sun's Luminosity.
